Redis Enterprise databases (REDB)

This section contains articles to help you manage your Redis Enterprise databases (REDBs).

Manage Redis Enterprise databases on Kubernetes

This section describes how the database controller provides the ability to create, manage, and use databases via a database custom resource.

Establish external routing with an ingress controller

Configure an ingress controller to access your Redis Enterprise databases from outside the Kubernetes cluster.

Configure Istio for external routing

Configure Istio as an ingress controller for access to your Redis Enterprise databases from outside the Kubernetes cluster.

Create replica databases on Kubernetes

How to create and automate database replicas using the database controller
