CallNext

```java
public static java.lang.Object callNext(java.lang.String... args)
```

When you override a Redis command with the `CommandOverrider`, use `callNext` to run the next execution that overrides the command or the original command itself.

It is a more flexible version of `callNextArray` since the list of string arguments does not have to be an explicit `String[]` object. This allows function calls like: `callNext("key", "value").`

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>args</td>
<td>string</td>
<td>Redis command arguments</td>
</tr>
</tbody>
</table>

**Returns**

Returns the command result. It could be a string or an array of strings, depending on the command.

**Examples**

Without `String[]`:

```java
GearsBuilder.callNext("restaurant:1", "reviews", "50");
```

With `String[]`:

```java
GearsBuilder.callNext(new String[]{"restaurant:1", "reviews", "50"});
```
