Hashtag

```java
public static java.lang.String hashtag()
```

Returns a string that maps to the current shard according to the cluster slot mapping.

**Note:** You can use the `hashtag` function when you need to create a key that resides on the current shard.

**Parameters**

None

**Returns**

Returns a string that maps to the current shard.

**Example**

The following example uses the `hashtag` function to calculate the hslot. The string maps to the current shard.

```java
GearsBuilder.execute(
    "SET",
    String.format("key{%s}", GearsBuilder.hashtag()),
    "1"
);
```
