REST API Examples

Create and edit subscriptions
This article describes how to create and manage a subscription using `cURL` commands.

Create and manage databases
This article describes how to create and manage a database using `cURL` commands.

Update databases
How to construct requests that update an existing database.

Database backup and import
When you create or update a database, you can specify the backup path. The import API operation lets you import data from various source types and specified locations.

Estimate cost
How to evaluate the cost of a specific subscription or database without changing existing resources.

Audit using Service Log
Use the service log to track and audit actions performed in the account

View account information
Get initial information on account parameters

Create and manage cloud accounts
Cloud accounts specify which account to use when creating and modifying infrastructure resources.
